Please note the Windows Smartphone router does not support sending of GPS co-ordinates even if the device has GPS.

# destiny.router glossary of terms

A range of routers are available from Destiny Wireless for use with your Digital Pen and Paper solution. These routers vary in functional capability dependent on the mobile platform of your phone. The router extracts the data from the pen, stores it on the phone and sends it on for processing on the Destiny Server Farm. Once received successfully by the Destiny Server Farm, the form is deleted from the mobile phone.

## **Fire and Forget**

Starts the router automatically on mobile phone power on. The mobile phone will store all pen messages until in GPRS coverage. At this time it will automatically try and send the data through to the Destiny Server Farm. The ability of the router to run as a minimised application on the mobile phone so that the user can utilise other mobile applications whilst the router is still running.

## **Photo Attach**

Allows the user to attach one or many photos to a form and send the images up to the Destiny Server Farm along with the pen data.

## **Populated Handset Verification**

Identified fields will be converted from original hand-written text to text on the mobile phone so that users can edit the text prior to onward sending to the Destiny Server Farm.

## **GPS Co-ordinate Capture**

Records the GPS co-ordinates from the integrated GPS device of the phone at the point at which the form is completed and the send pidget is ticked.

## **Open First Functionality**

Please Note – the JAVA router application will need to be selected and opened by the user prior to ticking the 'send form' pidget in order to allow the information to transfer from pen to handset correctly.

## **Unpopulated Handset Verification**

The router will NOT convert the handwriting from the page to the handset. Any critical or mandatory information will have to be re keyed by the user prior to sending the information through.
